Pre-submit:
Write a few simple test cases if sample is not enough.
Are time limits close? If so, generate max cases.
Is the memory usage fine?
Could anything overflow?
Make sure to submit the right file.

Wrong answer:
Print your solution! Print debug output, as well.
Are you clearing all data structures between test cases?
Can your algorithm handle the whole range of input?
Read the full problem statement again.
Do you handle all corner cases correctly?
Have you understood the problem correctly?
Any uninitialized variables?
Any overflows?
Confusing N and M, i and j, etc.?
Are you sure your algorithm works?
What special cases have you not thought of?
Are you sure the STL functions you use work as you think?
Add some assertions, maybe resubmit.
Create some testcases to run your algorithm on.
Go through the algorithm for a simple case.
Go through this list again.
Explain your algorithm to a teammate.
Ask the teammate to look at your code.
Go for a small walk, e.g. to the toilet.
Is your output format correct? (including whitespace)
Rewrite your solution from the start or let a teammate do it.

Runtime error:
Have you tested all corner cases locally?
Any uninitialized variables?
Are you reading or writing outside the range of any vector?
Any assertions that might fail?
Any possible division by 0? (mod 0 for example)
Any possible infinite recursion?
Invalidated pointers or iterators?
Are you using too much memory?
Debug with resubmits (e.g. remapped signals, see Various).

Time limit exceeded:
Do you have any possible infinite loops?
What is the complexity of your algorithm?
Are you copying a lot of unnecessary data? (References)
How big is the input and output? (consider scanf)
Avoid vector, map. (use arrays/unordered_map)
What do your teammates think about your algorithm?

Memory limit exceeded:
What is the max amount of memory your algorithm should need?
Are you clearing all data structures between test cases?
```

Data structures (2)

HashMap.h

Description: Hash map with mostly the same API as unordered_map, but ~3x faster. Uses 1.5x memory. Initial capacity must be a power of 2 (if provided).

d77092, 7 lines

```
#include <bits/extc++.h>

Number Theory (3)

Euclid.hpp

Description: Finds two integers x and y,such that $ax + by = \gcd(a, b)$. If you just need gcd, use the built in __gcd instead. If a and b are coprime, then x is the inverse of $a \pmod b$. $x = x_0 + k * (b/g)$ $y = y_0 - k * (a/g)$

"src/contest/template.hpp" 33ba8f, 5 lines

```
ll euclid(ll a,ll b,ll &x,ll &y){
  if(!b)return x=1,y=0,a;
  ll d=euclid(b,a%b,y,x);
  return y-=a/b*x,d;
}
```

CRT.hpp

Description: Chinese Remainder Theorem.

crt(a, m, b, n) computes x such that $x \equiv a \pmod m$, $x \equiv b \pmod n$. If $|a| < m$ and $|b| < n$, x will obey $0 \le x < \text{lcm}(m, n)$. Assumes $mn < 2^{62}$. If x0 and y0 is one of the solutions of ax + by = g, then the general solution is x = x0 + k * (b / g) and y = y0 - k * (a / g).

Time: $\log(n)$

"src/contest/template.hpp", "src/number-theory/Euclid.hpp" cfd447, 7 lines

```
ll crt(ll a,ll m,ll b,ll n){
  if(n>m)swap(a,b),swap(m,n);
  ll x,y,g=euclid(m,n,x,y);
  if((a-b)%g!=0)return -1LL; // no solution
  x=(b-a)%n*x%n/g*m+a;
  return x<0?x+m*n/g:x;
}
```

FloorSum.hpp

Description: Floor sum function. $f(a, b, c, n) = \sum_{x=0}^{n} \lfloor \frac{ax+b}{c} \rfloor$ becareful when a,b,c are negetive (use custom floor division and mod instead)

Time: $\mathcal{O}(\log a)$

"src/contest/template.hpp" d088d2, 7 lines

```
ll floor_sum(ll a,ll b,ll c,ll n){
    ll res=n*(n+1)/2*(a/c)+(n+1)*(b/c);
    a%=c,b%=c;
    if(a==0)return res;
    ll m=(a*n+b)/c;
    return res+n*m-floor_sum(c,c-b-1,a,m-1);
}
```
